Cold Spring Harbor, L.I., N.Y.

Dear Evelyn:

You will find herewith three contributions for the next MGB, which should last for some time. Two of these are experimental reports; one represents a section which might well become a regular feature. For future issues, it might be advisable to set an earlier deadline for "comments on recent papers", to give time for a reply if one is called for. I am in direct correspondence with Dianzini, and will urge him to submit his remarks if he has any which are relevant.

An improvised bibliography is also enclosed. I would appreciate its return when you are through with it. Also please ignore the material folded under the line. Two abstracts are also included which should perhaps be included. There is also Esther's paper with Giles, in case he does not send the reference:

Giles, N.H., Jr., and Esther Z. Lederberg, 1948, Induced reversions of biochemical mutants in Neurospora crassa, 35: 150-57.

A Miss Schwartz has applied for an assistantship here, under the handicap of an execrable academic record. I would appreciate your comments. I would appreciate, even more, hearing what you may know of Elise Kahn, in particular how she has fitted into your laboratory community. I hate to put such a burden on you, but your frank comment might help to evaluate other information.

Yours sincerely,

Joshua Lederberg.
